

Virtual Server Solution

A **major medical services provider** in the mid-California area was looking to **consolidate the large number of physical servers** they had and **update to the latest Windows O/S**. Abtech proposed a **virtual server solution running on Dell servers and storage**. This was **installed and configured by our engineers and integrated with their existing network**. The project included three further phases to implement a **backup solution using Veeam, migrate Exchange to 2019, and replace their existing 1Gb switches with 10Gb switches**.

The customer is now working with Abtech on adding a cloud service for disaster recovery.
